

# Asset Care and Management – A Systematic Approach

Asset management is about finding the optimal balance between the needs of the process and the needs of your mechanical assets to achieve your business objectives of safety, quality, and profitability. This means that there needs to be a systematic approach that optimizes your profitability by addressing all available systems associated with your enterprise's machinery. This strategic, results-based program will include:

- Machinery condition assessment
- Machinery performance testing and analysis
- Lubrication program administration and analysis
- Bearing selection and rotordynamic consulting
- Identification/elimination of defects in process/maintenance systems

Implementing an asset management program can be a significant undertaking. It transcends simply purchasing the right instrumentation and software. It requires experienced people who can specify, install, configure, integrate, maintain, optimize, and operate the system, and then train the people who will use it.

Bently Nevada is unmatched in our scope and experience. We recognize your knowledge of machinery operation, maintenance histories, and plant processes. By working together, we can combine your knowledge with our expertise in machinery management to help ensure the success of your Asset Care Program. ☺
